Sigma Notation: Simplification Rules

Video companion

1 Distributive property

Examples:

$$\sum_{i=1}^{4} i^2 = 30$$

$$\sum_{i=1}^{4} 3i^2 = 3(1)^2 + 3(2)^2 + 3(3)^2 + 3(4)^2$$

$$= 3[1^2 + 2^2 + 3^2 + 4^2]$$

$$= 3\left[\sum_{i=1}^{4} i^2\right]$$

$$\sum_{r=4}^{25} 18r^3 = 18 \left[\sum_{r=4}^{25} r^3 \right]$$

This is due to the distributive property:

$$a(b+c) = ab + ac$$

In other words, constants inside the summed expression can be pulled outside.

2 Commutative property

$$\sum_{i=1}^{4} (i^2 + 2i) = (1^2 + 2(1)) + (2^2 + 2(2)) + (3^2 + 2(3)) + (4^2 + 2(4))$$
$$= (1^2 + 2^2 + 3^2 + 4^2) + (2(1) + 2(2) + 2(3) + 2(4))$$
$$= \left(\sum_{i=1}^{4} i^2\right) + \left(\sum_{i=1}^{4} 2i\right)$$

This is due to the *commutative property*:

$$a+b=b+a$$

In other words, we can add the terms in any order.

3 Summation of constants

Examples:

$$\sum_{r=1}^{7} 8 = 8 + 8 + 8 + 8 + 8 + 8 + 8 + 8 + 8$$

$$= 7 \cdot 8$$

$$= 56$$

When summing constants, you can multiply the constant by the number of indices you count.
